Outline

- > Plasma and Space Environment
- > Lunar Exploration (in the Age of Artemis)
 - Dielectric charging and dust transport
 - In-Situ Resource Utilization (ISRU)
 - High-fidelity modeling and simulation
 - > Dusty Plasma
 - > Electrostatic Sieve Modeling
 - Ground vacuum-plasma chamber testing
- > Other on-going projects
 - Space/plasma propulsion
- > Openings!

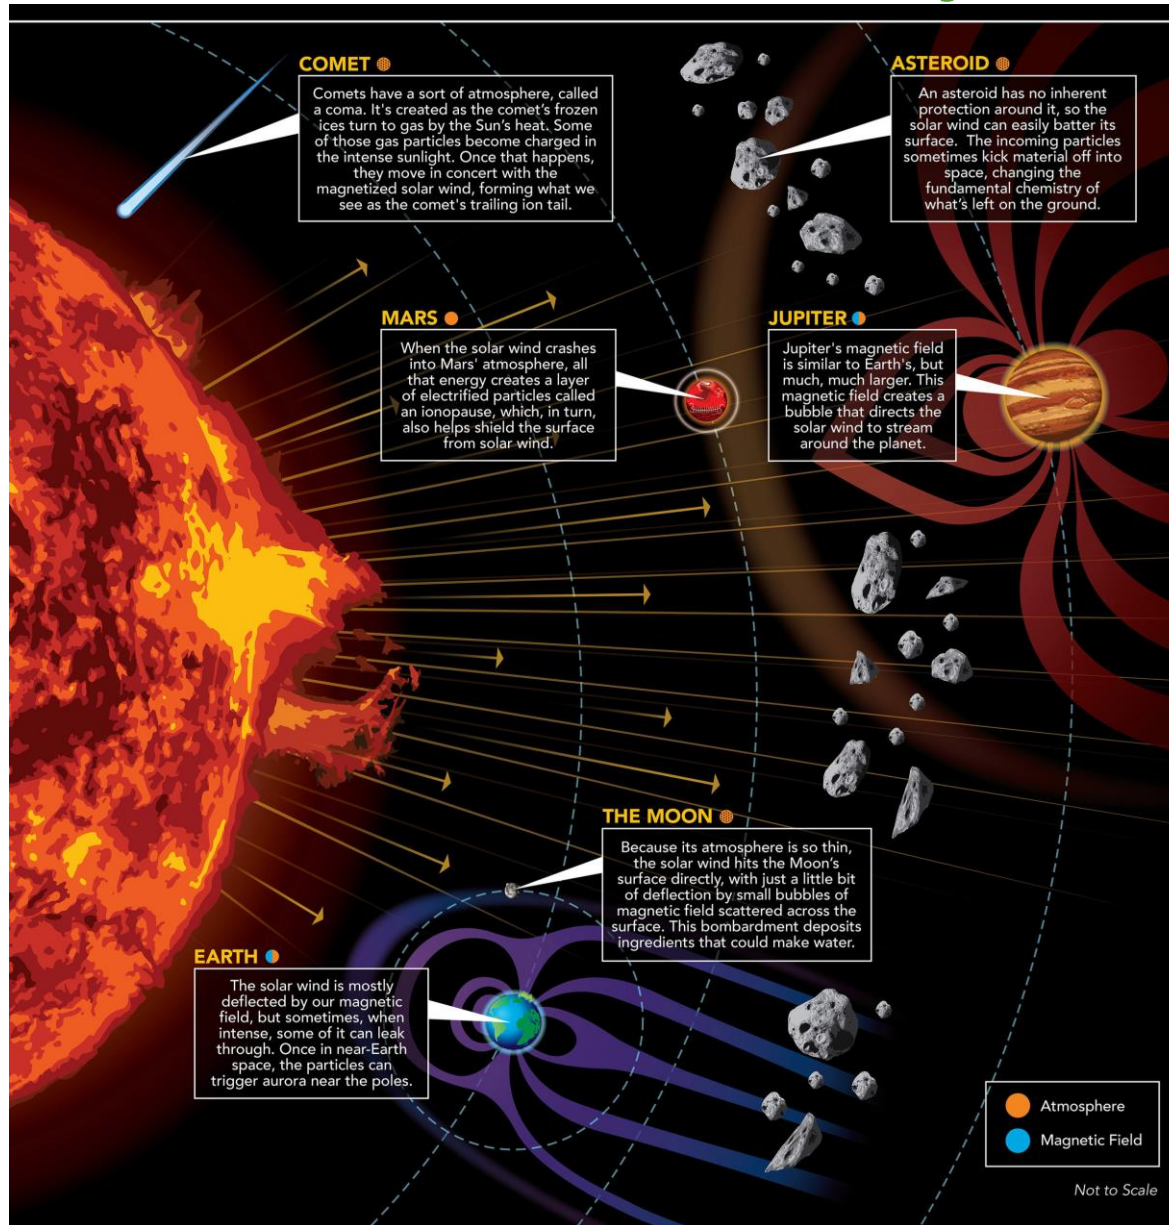

Plasma as the fourth state of matter...

- 99% of the matter in the known universe
- A **quasi-neutral** gas of charged (and neutral) particles exhibiting **collective** behavior
- **Spatial**: shielding distance (Debye length λ_D) \ll characteristic length of interest L
- **Temporal**: Oscillation frequency vs. collision frequency (with neutral particles): plasma or gas behavior

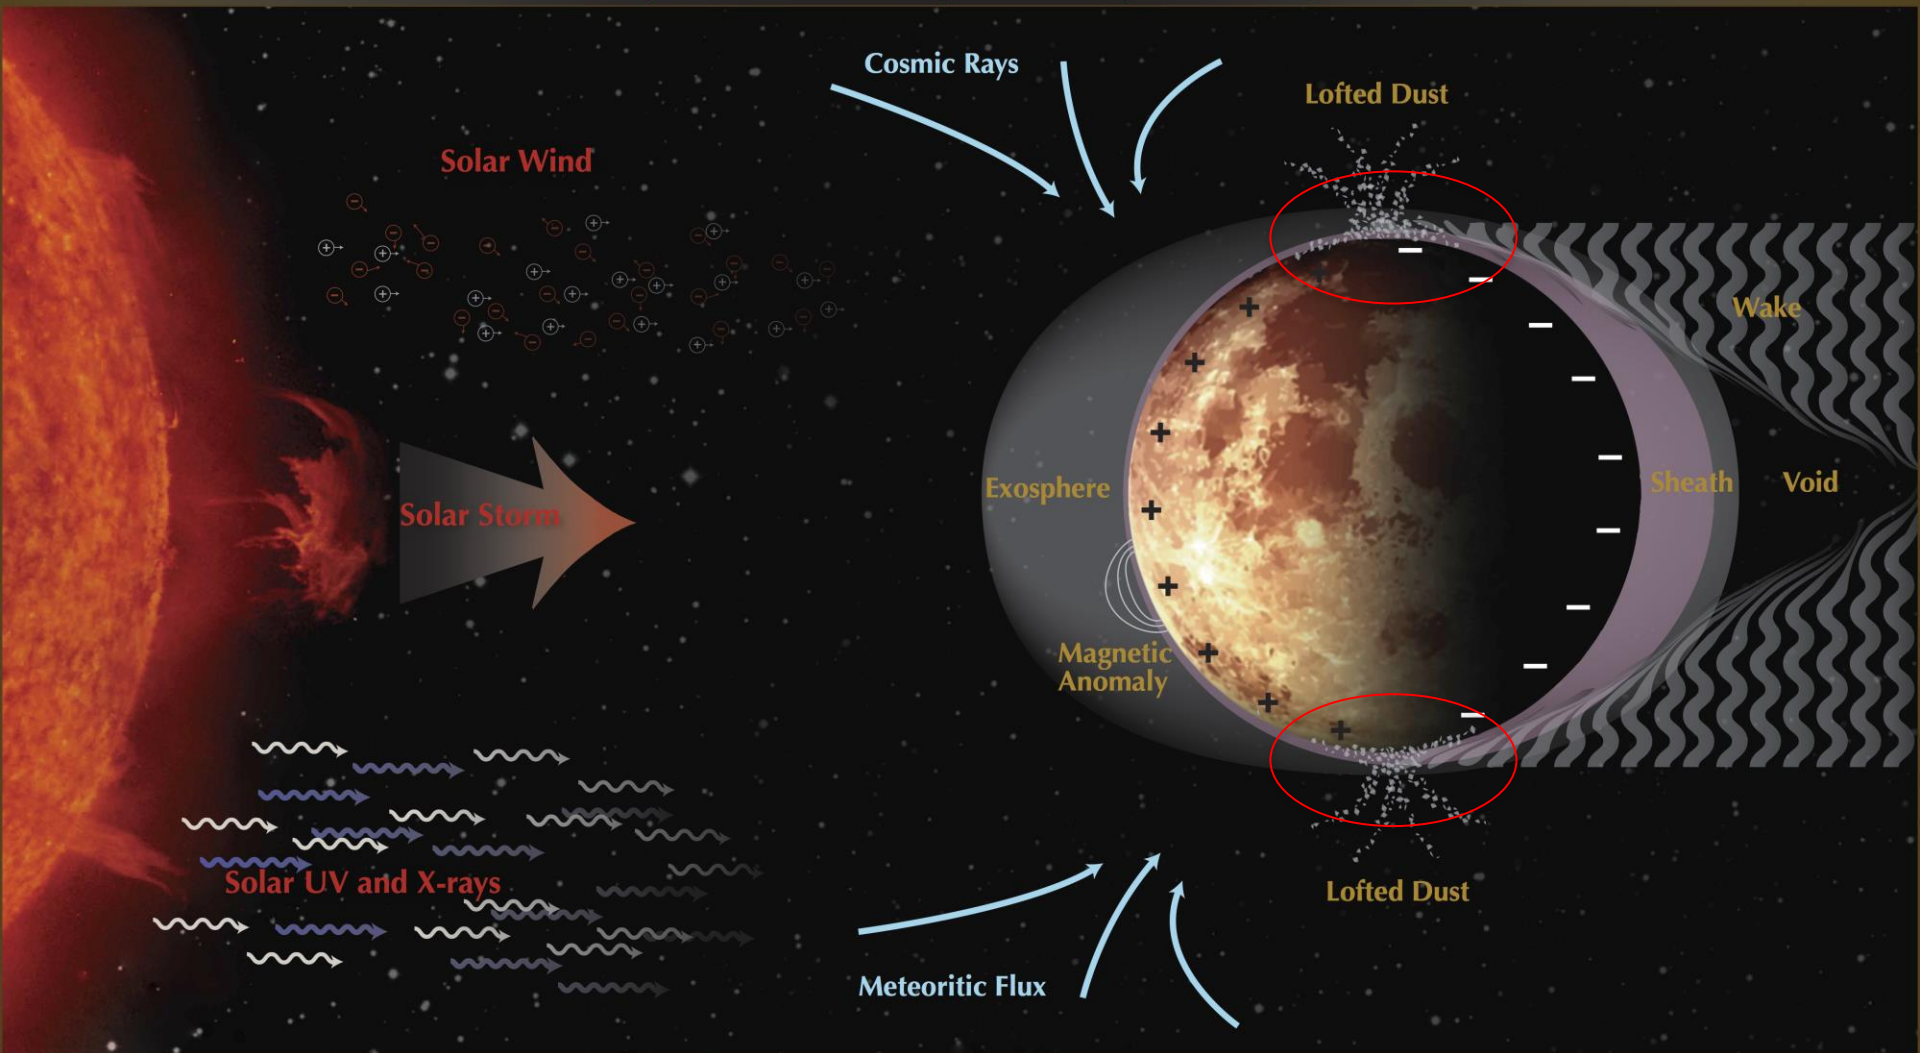

The space environment in our solar system

There are rich processes on the Moon

A Dynamically Coupled System

Lunar polar regions are of particular interest

At local scales, surface terrain is complex

https://www.nasa.gov/multimedia/imagegallery/image_feature_25.html, accessed 9/2/2020

NASA's vision for Artemis Base Camp

Figure 7: The lunar South Pole's Shackleton Crater, as captured by the Lunar Reconnaissance Orbiter, with the Capital Beltway overlaid for scale.

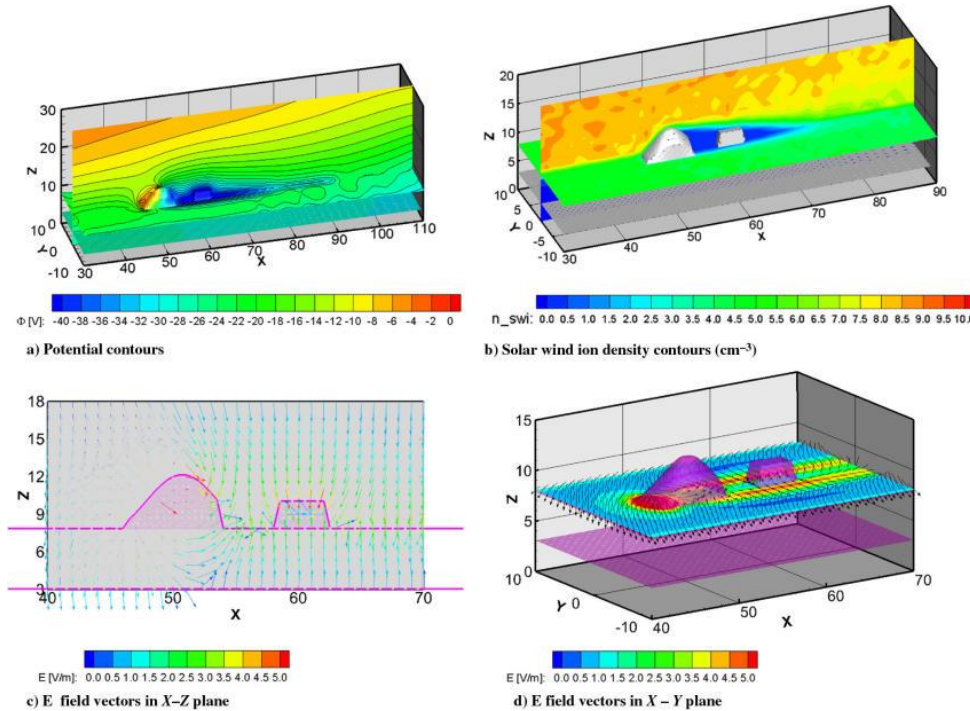

Dust... dust... (PROBLEM)

- Charged particles attach to instruments and spacesuits which could generate arcing
 - Risk of instrument failure
 - Threat to astronaut's health
- Critical to resolve surface charging

Apollo Astronaut Eugene Cernan Covered in Moon Dust

High-fidelity plasma simulation codes to study lunar surface charging

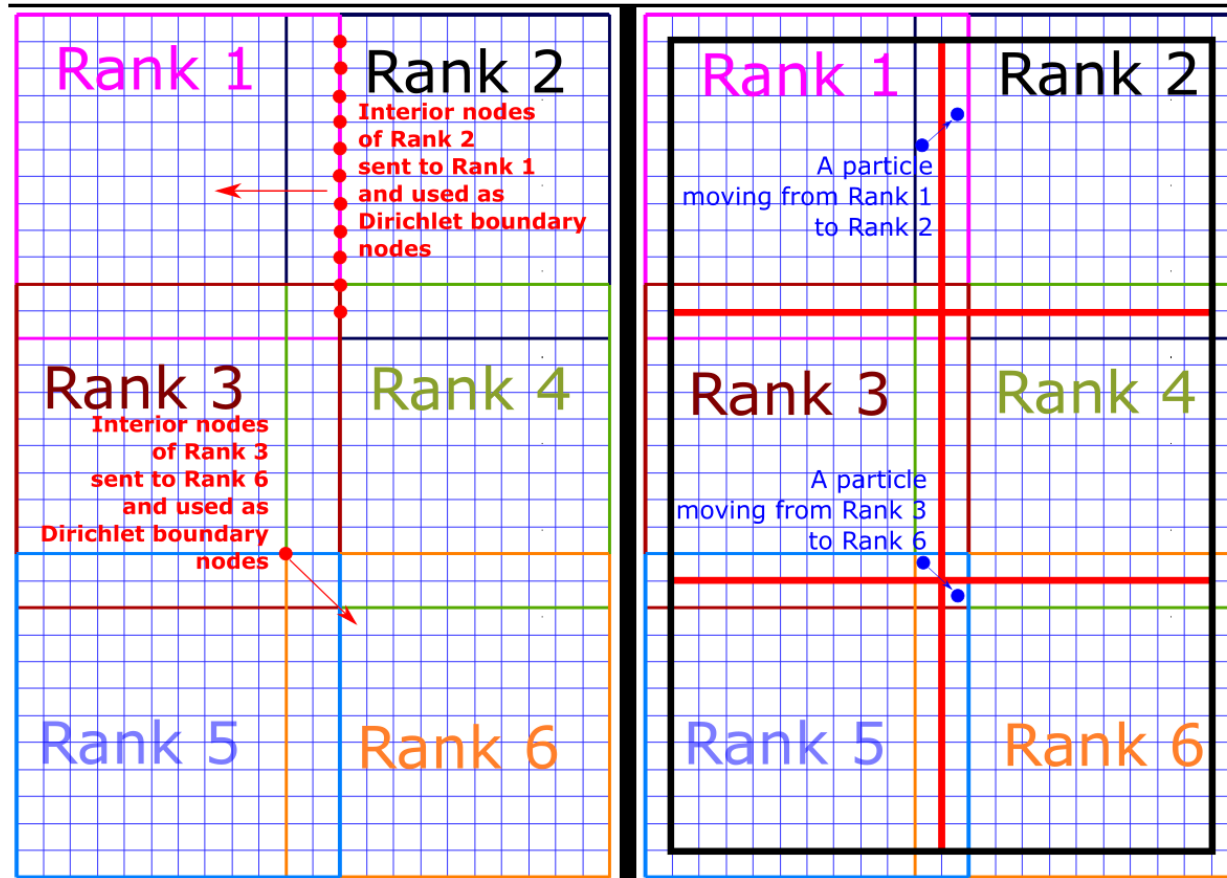

Han et al., Journal of Spacecraft and Rockets, 2018

Lund et al., AIAA 2020-1549

State of the art code: Parallel IFE-PIC (PIFE-PIC)

State of the art code: Parallel IFE-PIC (PIFE-PIC)

# of sub-domains	Efficiency E_{II}
1 (serial)	100.00%
64	109.02%
80	111.99%
100	106.57%
125	100.79%
150	94.99%
180	91.12%
216	89.62%
252	83.10%
294	68.35%
343	66.47%

Strong scaling: Han et al., SISC, 2021
Weak scaling: Lund et al., JCPM, 2022

Routine HPC: 2M mesh cells, 1B particles

Very detailed surface differential charging at crater scale

Ongoing: Grain scale charging, non-spherical shapes

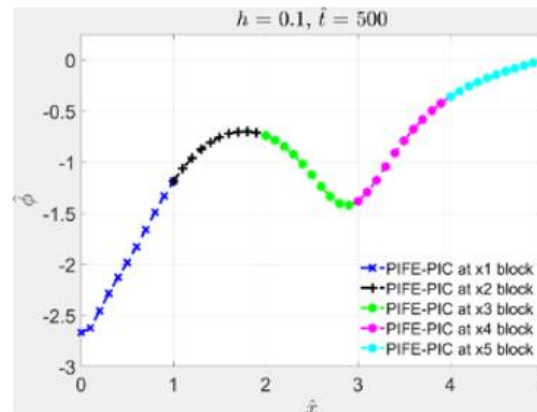

(a) Normalized electron density

(b) Normalized ion density

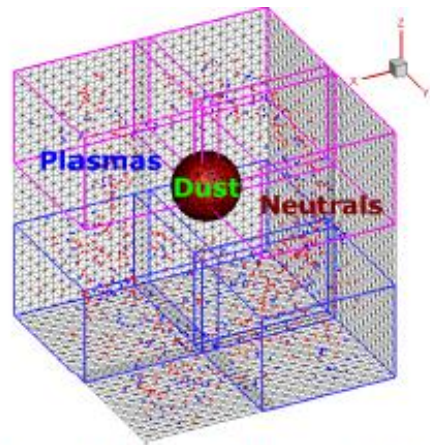

(c) Normalized potential

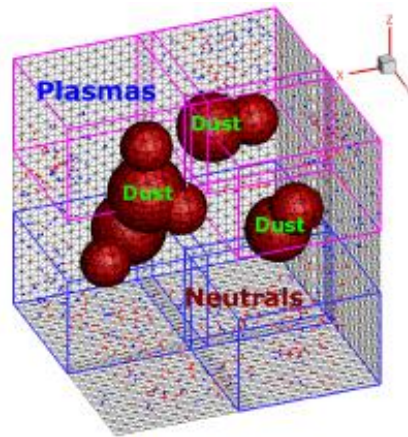

(d) Normalized potential profile along the x-direction

Looking into net charge on each grain
(for dust transport models)

Dusty plasma – rich physics unresolved

(a) Single-dust charging and forces/moments

(b) Multi-dust interaction

(c) Multi-dust packed near a flat surface

(d) Dust transport near complex surfaces

Dust... dust... (RESOURCE!)

- Lunar soils: oxygen, silicon, aluminum, calcium, iron, magnesium, titanium
- An ISRU approach: Beneficiation of regolith
 - Separation of particles by size
 - Traditional methods: mechanical sieve – not suitable for use on the Moon – SWaP constraints
 - Electrostatic / Electrodynamic methods: lower power and more compact

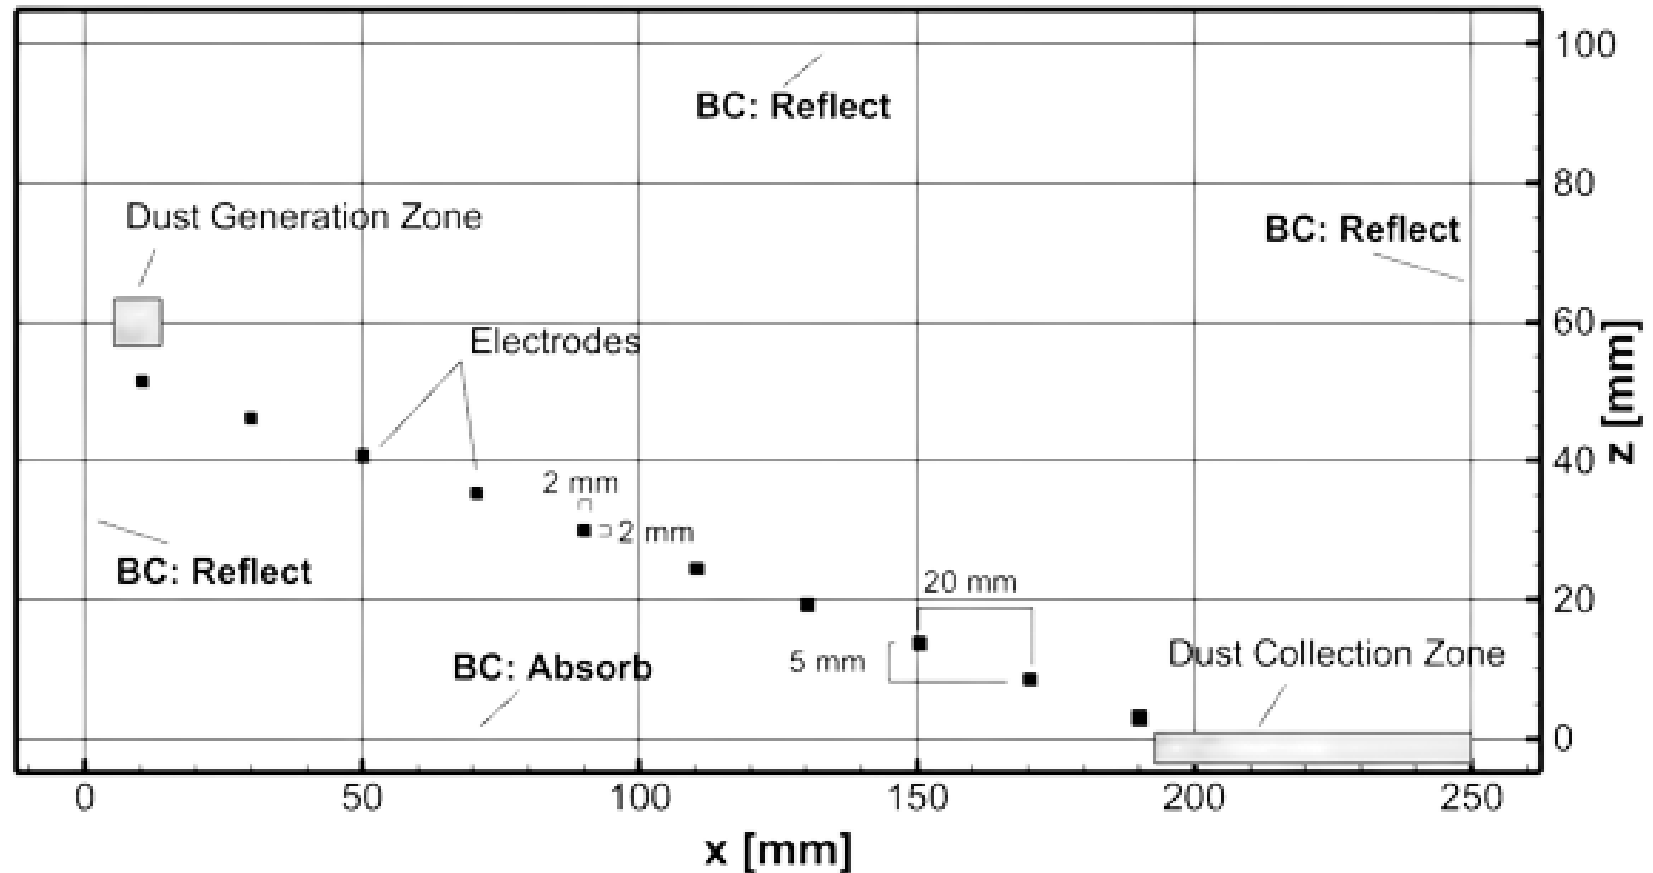

MISSOURI
S&T

Concept of Electrostatic Sieve

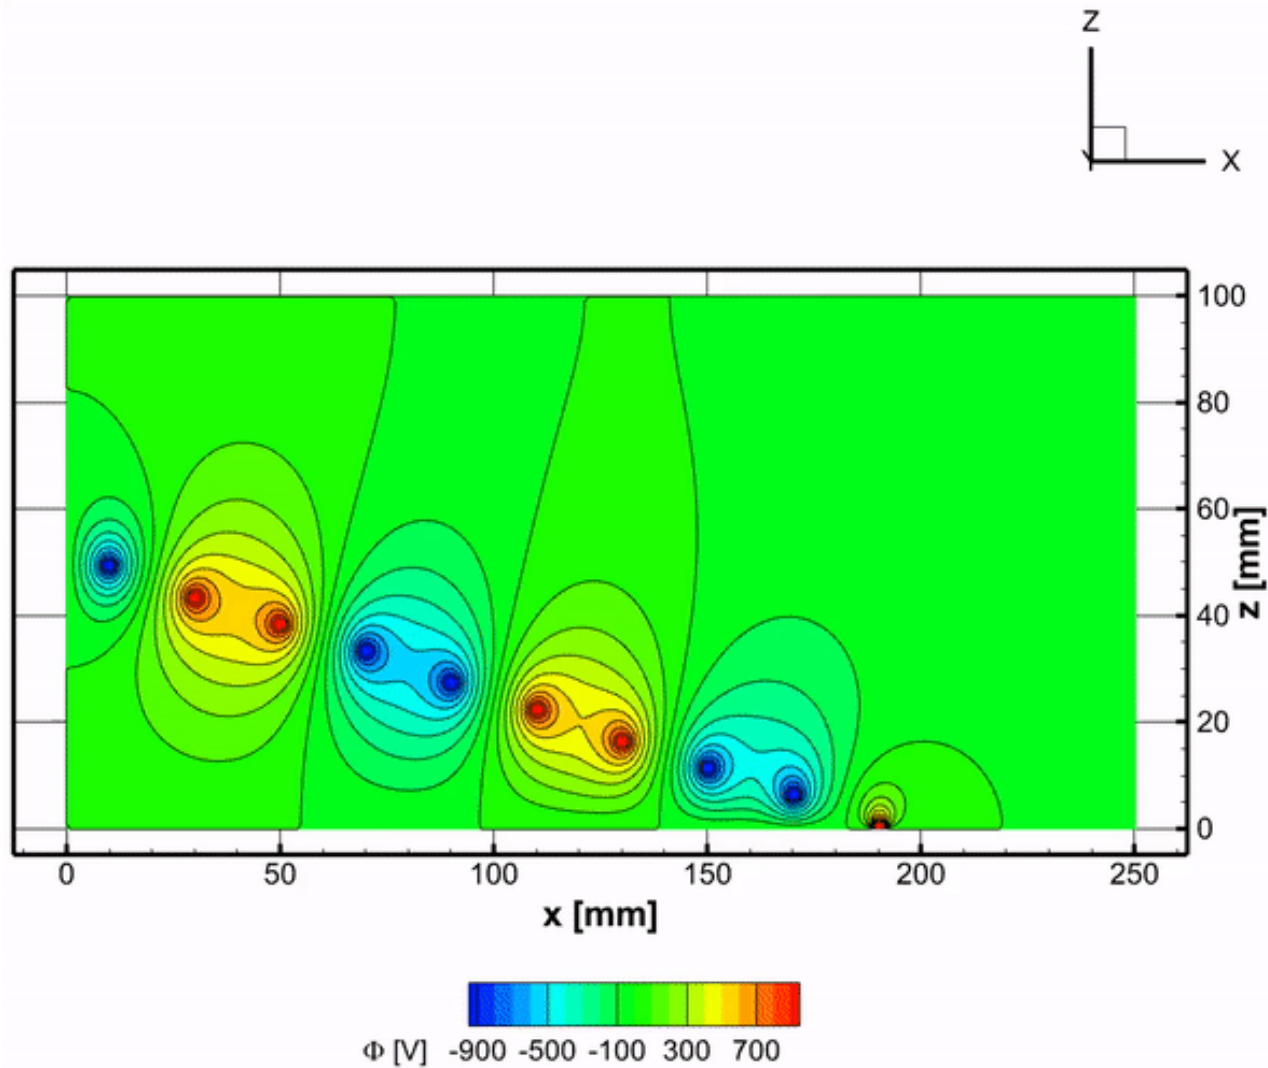

- Four-phase rectangular traveling wave and parallel electrodes to generate an electric field and separate dust
- Develop modeling capabilities for these concepts
- Use as an effective design and analysis tool

Modeling operation of an electrostatic sieve

Modeling operation of an electrostatic sieve

Modeling operation of an electrostatic sieve

Modeling operation of an electrostatic sieve

Ongoing: Ground testing in atmospheric conditions
